RE: Application of Geostatistical Techniques to Interpret Measured 2021 Water Levels

Dear Mr. Andruss,

Attachment A provides INTERA revised our analysis of the 2021 water based on comments submitted by the District to INTERA on June 15th.

As part of the transmission of this letter, INTERA has included separate presentations for Calhoun County GCD, Refugio GCD, Texana GCD and Victoria County GCD that summarize the results of the analysis of the 2021 water levels for their respective counties. The figures in these presentations have been revised as requested.

Please contact me if the District has any questions or comments on the final deliverables.

Sincerely,

A handwritten signature in black ink that reads "Steven C Young".

Steven C Young, PhD, PE, PG
Principal Geoscientist
INTERA, Incorporated

Attachment A

Application of Geostatistical Techniques to Interpret Measured 2021 Water Levels

Background

In 2021, INTERA completed a study (Young and others, 2021) that accomplished the four tasks shown below for Calhoun County Groundwater Conservation District (GCD), Refugio GCD, Texana GCD, and Victoria County GCD:

1. Assembled measured groundwater elevations from GCD and Texas Water Development Board (TWDB) databases over the interval from 2000 to 2020 and integrated them into a single data set;
2. Employed geostatistical methods for interpolating annual groundwater for the Chicot and Evangeline aquifers from 2000 to 2020;
3. Evaluated the annual changes in the measured groundwater elevations across the four counties and in selected wells;
4. Provided recommendations for future work.

The geostatistical method used to develop the baseline set of results was an application of ordinary kriging. Kriging is a geostatistical interpolation technique that considers both the distance and the degree of variation between known data points when estimating values in unknown areas. Ordinary Kriging provides the best linear unbiased prediction at unsampled locations and reproduces the measured values at all sampled locations exactly. To meet underlying assumptions that were used to develop ordinary Kriging, the measured water levels were detrended prior to the application of ordinary Kriging. The measured water levels were detrended using water levels simulated by the central Gulf Coast Groundwater Availability Model (GAM) that were smoothed using an algorithm described by Young and others (2021). The method was given the acronym SSWL+KR, which stands for smoothed simulated water levels and Kriged residuals.

SSWL+KR was used to interpolate the water level residuals for the years 2000 through 2020 for both the Chicot Aquifer, the Evangeline Aquifer, and the Chicot and Evangeline Aquifer, which is created by combining the Chicot and Evangeline aquifers into single aquifer. The interpolation generated interpolated surfaces with a resolution of 1,000 feet (ft) for each year. Using these surfaces, the average water levels were calculated by county and by year.

Analysis of 2021 Water Level Data

The 2021 water levels were assembled from data provided by the four previously mentioned GCDs and from data extracted from the TWDB Groundwater Database. Table 1 lists the 264 water levels and the wells used in the analysis. Figure 1 shows the location of the water levels that were used in the geostatistical analyses. The protocols used to assign an aquifer to a well and to check water levels are explained by Young and others (2021).

Figures 2 and 3 show water level contours for the Chicot Aquifer generated using SSWL+KR for the years 2000 and 2021, respectively. Figure 4 provides contours of the change in water levels from 2000 to 2021 for the Chicot Aquifer. Within the 14 county-area covered by the analysis, the region of lowest amount of water level change includes the four counties covered by Calhoun County GCD, Refugio GCD, Texana GCD, and Victoria County GCD. Across these four GCDs, the change in the water levels in the Chicot Aquifer from 2000 to 2021 is ranges between -25 ft and 15 feet. .

Figures 5 and 6 show water level contours for the Evangeline Aquifer generated using SSWL+KR for the years 2000 and 2021, respectively. Figure 7 provides contours of the change in water levels from 2000 to 2021 for the Evangeline Aquifer. Within the 14 county-area covered by the analysis, the greatest amont of change occurs in Victoria County where the Evangeline Aquifer experienced up to a 40 ft rise in water levels from 2000 to 2021. Across Jackson, Calhoun, and Refugio counties, the change in the Evangeline water levels ranged from about -10 feet to about 20 feet.

Tables 2 through 5 provide the average value for the annual water levels for Calhoun County GCD, Refugio GCD, Texana GCD and Victoria County GCD from 2000 to 2021 for the Chicot Aquifer, the Evangeline Aquifer, and the combination of the Chicot and Evangeline aquifers. In addition, the average annual water levels, the tables also provide the difference in the annual water levels for each year and the year 2000.
